PRINT HEAD APPARATUS WITH MALFUNCTION DETECTOR

Inventor(s): Robert Paasch

5

FIELD OF THE INVENTION

64416610-107209
The present invention relates to print heads used in
printers and plotters and the like and, more specifically,
10 to detecting malfunctions within such print heads.

BACKGROUND OF THE INVENTION

Printers and plotters are known in the art and
include those made by Hewlett-Packard, Canon and Epson,
15 amongst others. In the discussion that follows, printers
and plotters are referred to collectively with the term
"printers". Problems associated with current printers and
print head arrangements include that the print head may
run out of ink while printing, the print head nozzle may
20 become clogged and the ink expulsion mechanism may not
fire, amongst other malfunctions. Evidence of such
malfunctions are usually detected when the printed
document is pulled out of the printer and examined
visually. At this point it is too late for appropriate
25 correction. Some types of electronic sensing are known in
the art, such as techniques for detecting when an ink
expulsion mechanism has not fired. These techniques,
however, are limited in scope and do not, for example,
detect when a nozzle is clogged or unclogged.

30 A need thus exists to detect print head malfunction
in such a manner as to eliminate or minimize corruption of

- 2 -

a printed image. Early detection of a malfunction permits preventative steps to be taken such as print head replacement or software based compensation within the firing algorithm, etc.

5

SUMMARY OF THE INVENTION

Accordingly, it is an object of the present invention to provide a print head that can detect a malfunction therein.

10 It is another object of the present invention to provide a print head that can detect such conditions as a clogged nozzle, no fire and dry fire.

It is another object of the present invention to provide a print head that incorporates a pressure sensor and circuitry therefor that detects firing of an ink
15 expulsion mechanism and determines characteristics about the firing based on the sensed signals.

It is also an object of the present invention to provide a print head with a piezoelectric type pressure
20 sensor.

These and related objects of the present invention are achieved by use of a print head apparatus with a malfunction detector as described herein.

The attainment of the foregoing and related
25 advantages and features of the invention should be more readily apparent to those skilled in the art, after review of the following more detailed description of the invention taken together with the drawings.

- 3 -

BRIEF DESCRIPTION OF THE DRAWINGS

Fig. 1 is a cross sectional side view of a print head in accordance with the present invention.

Fig. 2 is a side view of a piezoelectric acoustic wave transducer in accordance with the present invention.

Fig. 3 is a side view of a portion of an interdigitated pressure wave transducer in accordance with the present invention.

Fig. 4 is a plan view of an arrangement of piezoelectric acoustic pressure wave transducers and interdigitated piezoelectric pressure wave transducers in a print head in accordance with the present invention.

Fig. 5 is a graph of illustrating the pressure on an expulsion mechanism surface versus time for a clogged nozzle firing and an unclogged nozzle firing is shown.

DETAILED DESCRIPTION

Referring to Fig. 1, a cross sectional side view of a print head 10 in accordance with the present invention is shown. Print head 10 includes a substrate in or on which is provided an ink expulsion mechanism 14. Ink expulsion mechanism 14 may expel ink through thermal or mechanical excitation or through other appropriate expulsion means. In a preferred embodiment, mechanism 14 is thermally actuated and may be implemented with a resistive element as is known in the art. Ink expulsion mechanism 14 is controlled by off-die circuitry or by a combination of on-die and off-die circuitry as is known. Representative off-die coupling is indicated by signal line 15 and contact pad 16.

- 4 -

A barrier layer 20 is formed on substrate 12 and an orifice plate 30 is formed on barrier layer 20. The substrate, barrier layer and orifice plate define an ink well or conduit 24 that channels ink from a supply (not shown) into proximity with the expulsion mechanism. An orifice or nozzle 31 through which ink is expelled is formed in the orifice plate and positioned over ink expulsion mechanism 14. Suitable material for barrier layer 20 and orifice plate 30 are known in the art.

Assuming that ink expulsion mechanism 14 is a thermally actuated device such as a resistor, an ink drop is expelled by essentially boiling a drop of ink through nozzle 31. During formation and collapse of a boiling ink bubble, a series of acoustic pressure waves 26 (hereinafter referred to as "pressure waves") are produced. These waves propagate through the components of the print head, including primarily the substrate and ink well. In the substrate (and conventional thin film layers formed thereon), both longitudinal and shear waves are produced. Longitudinal waves can be detected by an interdigitated piezoelectric pressure wave transducer 50 or the like which is described in more detail with reference to Figs. 3 and 4. In ink well 24, longitudinal pressure waves are produced. These waves can be detected with a piezoelectric acoustic pressure wave transducer 40 which is described in more detail with reference to Fig. 2. For purposes of the present discussion, the term "interdigitated transducer" will be used for the interdigitated piezoelectric pressure wave transducer and the term "acoustic transducer" will be used for the piezoelectric acoustic pressure wave transducer. While

- 5 -

both an acoustic transducer and an interdigitated transducer are described as being provided on substrate 12, it should be recognized that they need not be provided together because either transducer is capable of sufficiently detecting pressure waves. The provision of both provides redundancy.

Acoustic transducer 40 and interdigitated transducer 50 are preferably coupled to processing circuit 60. Processing circuit 60 preferably includes an amplifier, a filter and an analog to digital converter or related signal processing circuitry. Processing circuit 60 may be configured to provide the necessary processing to determine dry-fire, no-fire and clogged-fire conditions (that is, a misfire) or the sensor output signals can be delivered to off-die logic 70 for such processing. The output of processing circuit 60 is propagated over signal line 17 to contact pad 18.

Referring to Fig. 2, a side view of an acoustic transducer in accordance with the present invention is shown. Fig. 2 illustrates the acoustic transducer of Fig. 1 in more detail. Fig. 2 illustrates substrate 12 on which the following layers are formed: an insulation layer 21, a conductive coupling layer 41, piezoelectric material 42, a first and a second signal conductive layer 44,45, a passivation layer 47 and a surface coat layer 48. In a preferred embodiment, these layers are made of the following or a like material: insulation layer 21 is silicon dioxide (SiO_2), conductive layer 41 is tantalum aluminum (TaAl), piezoelectric material 42 is aluminum nitride (AlN), first and second conductive layers or traces 44,45 are aluminum (Al), passivation layer 47

- 6 -

includes a first layer of silicon nitride (Si_3N_4) and a second layer of silicon carbide (SiC), and coating 48 layer is tantalum (Ta). It should be recognized that the arrangement and composition of these layers may be altered in a manner consistent with device fabrication techniques without deviating from the present invention. It should also be recognized that other piezoelectric material such as zinc oxide (ZnO) or PZT may be used and that other types of suitable pressure sensors may be used.

The first and second conductive layers 44,45 form conductors for reading a voltage generated by piezoelectric material 42 in response to an incident pressure wave. A pressure wave traveling through the ink well compress the thin film stack, resulting in a mechanical strain in the thin film layers. In the piezoelectric layer, this strain produces a measurable electric charge across the two conductors.

Referring to Fig. 3, a side view of a portion of an interdigitated transducer in accordance with the present invention is shown. Fig. 3 illustrates the interdigitated transducer of Fig. 1. The layout of this transducer and its arrangement with another interdigitated transducer are shown in Fig. 4. Fig. 3 illustrates substrate 12 on which are formed insulation layer 21, piezoelectric material 52, first and second conductors 54,55 (only one of which is shown), a passivation layer 57 and a coating layer 58. The substrate, insulation layer, passivation layer and coating layer are as discussed above for acoustic transducer 40. The piezoelectric material and conductive layers are preferably similar in composition to their

- 7 -

counterparts in transducer 40, however, their areal arrangement is different as shown in Fig. 4.

Referring to Fig. 4, a plan view of an arrangement of acoustic transducers and interdigitated transducers in a print head in accordance with the present invention is shown. Fig. 4 illustrates substrate 12, a plurality of ink expulsion mechanisms 14, barrier layer 20, ink well 24, a plurality of acoustic transducers 40 and a plurality of interdigitated transducers 50. Orifice plate 30 would be placed over the arrangement of Fig. 4 with nozzles aligned with the ink expulsion mechanisms 14. It should be recognized that the transducer arrangement disclosed in Fig. 4 is representative and provided for pedagogical purposes. The ink expulsion mechanisms ink well and the size number and arrangement of transducers may be modified from that of Fig. 4 without departing from the present invention. Furthermore, it should be recognized that although the interdigitated transducers are shown in the ink well, since they detect pressure waves in the substrate they may be placed anywhere on the substrate including under the barrier layer.

The interdigitated transducers are preferably implemented as interdigitated conductors 54-55 placed over a corresponding pattern of piezoelectric material 52. These interdigitated transducers exhibit a directional detection characteristic that is advantageous to some implementations of the present invention. Fig. 4 illustrates two interdigitated pressure wave transducers 50 and 50' that are arranged orthogonally to one another. This arrangement facilitates detection of pressure waves traveling in different directions. The acoustic

- 8 -

transducers 40 of Fig. 4 are essentially as described above with references to Figs. 1 and 2. Each of transducers 40 and 50 are shown with their first and second conductors 44,45 and 54,55, respectively being coupled to vias 13 (under the barrier layer) that are coupled to signal processing circuit 60 of Fig. 1.

Referring to Fig. 5, a graph illustrating the pressure on the surface of resistor or expulsion mechanism 14 verses time for a clogged nozzle firing and an unclogged nozzle firing is shown. As alluded to above, the cavitation of the air bubble(s) at resistor or expulsion mechanism 14 during firing causes a considerable pressure spike on the surface of the resistor. This pressure spike is normally around 20MPa (greater than 10K PSI) and occurs at approximately 13.5 μ S after firing. When the nozzle associated with a particular resistor is clogged, however, the pressure spike has a different signature. Typically it is lower in magnitude by about 15-25 percent (e.g., approximately 16Mpa) and occurs earlier (e.g., 15-20% earlier, usually approximately 11 μ S). The combination of decreased magnitude and quicker response time permits differentiation of an unclogged firing from a clogged firing. The absence of a pressure wave indicates a "no-fire" event.

While the invention has been described in connection with specific embodiments thereof, it will be understood that it is capable of further modification, and this application is intended to cover any variations, uses, or adaptations of the invention following, in general, the principles of the invention and including such departures from the present disclosure as come within known or

- 9 -

customary practice in the art to which the invention
pertains and as may be applied to the essential features
hereinbefore set forth, and as fall within the scope of
the invention and the limits of the appended claims.

- 10 -

CLAIMS

1. A print head apparatus, comprising:
a substrate;
5 an ink expulsion mechanism provided on said substrate; and
a first pressure sensor that is capable of detecting a signal related to a misfiring of said ink expulsion mechanism.
10
2. The apparatus of claim 1, wherein said sensor includes piezoelectric material.
3. The apparatus of claim 1, wherein said sensor is
15 formed on said substrate.
4. The apparatus of claim 1, further comprising:
a barrier layer formed on said substrate;
a cover plate having a nozzle therein formed on said
20 barrier layer and positioned such that said nozzle is aligned with said ink expulsion mechanism, said substrate, barrier and cover plate defining an ink well; and
wherein said first sensor is provided at said ink well in such a manner as to detect pressure waves
25 propagating in ink in said ink well caused by a misfiring of said ink expulsion mechanism.
5. The apparatus of claim 1, wherein said first pressure sensor is an acoustic wave piezoelectric
30 transducer.

- 11 -

6. The apparatus of claim 1, wherein said first pressure sensor is an interdigitated pressure wave transducer.

5 7. The apparatus of claim 1, further comprising a second pressure sensor, wherein said first pressure sensor is an acoustic wave piezoelectric transducer and said second pressure sensor is an interdigitated pressure wave transducer.

10 8. The apparatus of claim 1, wherein said ink expulsion mechanism is thermally actuated.

15 9. The apparatus of claim 6, further comprising a second pressure sensor that is an interdigitated pressure wave transducer and said first sensor and said second sensor are provided in a substantially orthogonal arrangement on said substrate.

20 10. A print head apparatus, comprising:
a substrate;
an ink expulsion mechanism formed on said substrate;
a cover plate spaced from said ink expulsion
mechanism and having a nozzle formed therein, said nozzle
25 being aligned with said ink expulsion mechanism; and
a sensor mechanism that is capable of determining
when said nozzle is clogged.

30 11. The apparatus of claim 10, wherein said sensor mechanism is capable of determining when said nozzle is unclogged.

- 12 -

12. The apparatus of claim 10, wherein said sensor mechanism is capable of determining one or more of the group of conditions including dry-fire and no-fire conditions.

13. The apparatus of claim 10, wherein said sensor is a pressure sensor.

14. The apparatus of claim 13, wherein said sensor includes piezoelectric material.

15. The apparatus of claim 10, wherein said sensor includes one or more of the group of sensors including an piezoelectric acoustic wave transducer and an interdigitated pressure wave transducer.

16. The apparatus of claim 10, wherein said sensor mechanism is capable of detecting a magnitude and timing of a pressure wave generated by a firing of said ink expulsion mechanism.

17. A method of monitoring performance of a print head, comprising the steps of:
attempting expulsion of a volume of ink from a print head;
detecting within said print head a characteristic of a pressure wave generated by said attempt to expel said volume of ink.

30

- 13 -

18. The method of claim 17, further comprising the step of determining from said detected characteristic a status of said attempted expulsion of said volume of ink.

5 19. The method of claim 17, wherein said detecting step includes the step of detecting the presence or absence of a pressure wave.

20. The method of claim 17, wherein said detecting
10 step includes the step of detecting a magnitude and timing of said pressure wave.

21. The method of claim 20, wherein said detecting
step further comprises the steps of establishing a first
15 magnitude related to an expulsion of said volume of ink and detecting a second magnitude in the range of 15% to 25% less than said first magnitude.

22. The method of claim 20, wherein said detecting
20 step further comprises the steps of establishing a first timing of said pressure wave related to an expulsion of said volume of ink and detecting a second timing in the range of 15% to 20% earlier than said first timing.

23. A printhead for an inkjet printing apparatus
25 comprising:

a substrate;
at least one ink ejector disposed on said substrate;
an interdigitated pressure wave transducer disposed
30 on said substrate and having a directional detection characteristic whereby a pressure wave traveling in a

- 14 -

predetermined direction from said at least one ink ejector is preferentially detected.

24. A printhead in accordance with claim 23 further comprising a second interdigitated pressure wave transducer disposed on said substrate and having a directional detection characteristic oriented such that a pressure wave traveling in a second direction different than said predetermined direction is preferentially detected.

25. A printhead in accordance with claim 24 wherein said second direction is orthogonal to said predetermined direction.

26. A method of detecting a misfiring nozzle in an inkjet printhead comprising the steps of:
establishing a first magnitude of a pressure wave corresponding to an ejection of a predetermined volume of ink from a nozzle; and
detecting a second magnitude of a pressure wave in the range of 15% to 25% less than said first magnitude whereby a misfiring nozzle may be detected.

27. A method of detecting a misfiring nozzle in an inkjet printhead comprising the steps of:
establishing a first timing of an arrival of a pressure wave from an ejection of a predetermined volume of ink from a nozzle; and

- 15 -

detecting a second timing of an arrival of a pressure wave in the range of 15% to 20% earlier than said first timing whereby a misfiring nozzle may be detected.

09416648-101259

- 16 -

ABSTRACT OF THE DISCLOSURE

5 A print head and method that are capable of detecting
a plurality of performance conditions such as a dry-fire,
no-fire or clogged-nozzle condition. Pressure wave
sensors within a print head are disclosed that are capable
of detecting pressure waves generated by the firing of an
ink expulsion mechanism. The characteristics of the
10 pressure wave generated by the firing event (e.g.,
magnitude and timing) are indicative of the operating
condition within the head. Multiple sensor types are
disclosed.
